Experience & skills

HARD SKILLS:

I'm a self-taught JS React engineer, with couple pet-projects [as a socialnetwork](#) and big interest in futuristic tech.
+ In my pet-projects I've been using Redux in BLL creating reducers and React: hooks (custom as well), async await, instances in DAL to connect to the server.
+ As well, I've tracked dev. Process by using Git/GitHub and Node console, so You may check all the way and technics used in my works.
+ I have knowledge of HTML/CSS/SASS/SCSS principles with BEM and Prettier extension for VS-code IDEA, what allows me to create a nice looking UI and well readable code.
+ I acquainted with Web Accessibility standards for better and higher ranking SEO.
+ Unit testing I've done with Jest, debugging in Devtools console using breakpoint or set key word in code.

SOFT SKILLS:

I'm in regime just cuz I like structure and order in life and things surrounding me, so I try to manage well my time.
Self-awareness and open-mindedness bring clarity of my work results or areas to improve.
I've learned English by my own (with free resources in internet) and am proud of it, practice & patience brought quality :)
I appreciate constructive critics and I know that growth is never easy, I may be wrong, but I will fix it!
Furthermore, I like challenges and solving problems, because all that strengthening me, critical thinking and analysis are necessary toolkit for adaptability in our fast pace life.

Education

Dmitri Kuzuburden, the founder and a great lector of "IT-Incubator" school, gave me understanding and knowledge for begging my own path in to Software development. Learning new things and applying them in work for me like a game just for grown people. Software development looks like a constructor, and I'm getting happy when my code executes properly. I was learning all given materials by my own with no a mentor, looking for the solvation of any issue using: Google, Stack Overflow, Haber, YouTube, W3Schools, and Documentation. Now I have already a little community with guys like me (samurai), so we help each other with question about a code or associated things.
2021-2022

Summary

Fifteen years ago I was interested in mobile games development, but then it was complicated and almost no information in internet as it's now, so I didn't take it seriously then. Recently, I got to a point in my life where I had to take a decision what I want to do for my future, as I'm an active person and I have many interests. I thought to becoming a psychologist, but after I got deeper knowing about this profession and compared it with my priorities, I realized that I wanna work with brain and logic of a computer:)

Skills:

- Java script
- React
- Redux
- NodeJS
- VS-code
- NPM/YARN
- GitHub/BitBush
- HTML/CSS
- SASS
- Botstrap
- BEM
- Agile
- Scrum
- English B1

About me:

I am a responsible and friendly person who likes futuristic tech. I like to spend time in a healthy environment, being useful for others and improving my own skills.
Thank you for your time!
